Unittest/Git Assignment

For this assignment, you will be working in your capstone groups to create a Git repository and populate it with two classes and their associated unit tests. I have provided starter files for the two classes: a Point class and a BankAccount class. Your group should first create a Git repository, add everyone as contributors to the repository, and upload the two starter files. Next, you should create files for your unit tests (one file for each class) and create your unit tests *before* implementing the classes. Finally, implement the classes themselves and verify that all unit tests pass with your implementation. Add me (pwilkins05) to your repository so I can check your work.
